

P89V52X2

8-bit 80C51 low power 8 kB flash microcontroller with 256 B RAM, 192 B data EEPROM

Rev. 01 — 7 June 2007

Preliminary data sheet

1. General description

The P89V52X2 is an 80C51 microcontroller with 8 kB flash, 256 B of data RAM, and 192 B of data EEPROM. This device is designed to be a drop in and software compatible replacement for the P87C52, P87C52X2, P89C52, and P89C52X2 devices.

2. Features

2.1 Principal features

- 0 MHz to 33 MHz operating frequency in 12× mode, 20 MHz in 6× mode
- 8 kB of on-chip flash user code memory
- 256 B of RAM
- Enhanced UART
- Three 16-bit timers/counters
- Four 8-bit I/O ports
- Supports 12-clock (default) or 6-clock mode selection via software or In-Circuit Programming (ICP)
- DIP40, PLCC44, and LQFP44 packages
- Six interrupt sources with four priority levels
- Second DPTR register

2.2 Additional features

- Low EMI mode (ALE inhibit)
- Power-down mode with external interrupt wake-up
- Idle mode
- Extended temperature range
- Three security bits
- Programmable clock-out pin

3. Ordering information

Table 1. Ordering information

| Type number | Package | | Version |
|-------------|---------|--|----------|
| | Name | Description | |
| P89V52X2FN | DIP40 | plastic dual in-line package; 40 leads (600 mil) | SOT129-1 |
| P89V52X2FBD | LQFP44 | plastic low profile quad flat package; 44 leads; body 10 × 10 × 1.4 mm | SOT389-1 |
| P89V52X2FA | PLCC44 | plastic leaded chip carrier; 44 leads | SOT187-2 |

5.2 Pin description

Table 2. Pin description

| Symbol | Pin | | | Type | Description |
|--------------|-------|--------|--------|---------------------------|--|
| | DIP40 | LQFP44 | PLCC44 | | |
| P0.0 to P0.7 | | | | I/O | Port 0: Port 0 is an 8-bit open-drain bidirectional I/O port. Port 0 pins that have '1's written to them float, and in this state can be used as high-impedance inputs. Port 0 is also the multiplexed low-order address and data bus during accesses to external code and data memory. In this application, it uses strong internal pull-ups when transitioning to '1's. External pull-ups are required as a general purpose I/O port. |
| P0.0/AD0 | 39 | 37 | 43 | I/O | P0.0 — Port 0 bit 0. |
| | | | | I/O | AD0 — Address/data bit 0. |
| P0.1/AD1 | 38 | 36 | 42 | I/O | P0.1 — Port 0 bit 1. |
| | | | | I/O | AD1 — Address/data bit 1. |
| P0.2/AD2 | 37 | 35 | 41 | I/O | P0.2 — Port 0 bit 2. |
| | | | | I/O | AD2 — Address/data bit 2. |
| P0.3/AD3 | 36 | 34 | 40 | I/O | P0.3 — Port 0 bit 3. |
| | | | | I/O | AD3 — Address/data bit 3. |
| P0.4/AD4 | 35 | 33 | 39 | I/O | P0.4 — Port 0 bit 4. |
| | | | | I/O | AD4 — Address/data bit 4. |
| P0.5/AD5 | 34 | 32 | 38 | I/O | P0.5 — Port 0 bit 5. |
| | | | | I/O | AD5 — Address/data bit 5. |
| P0.6/AD6 | 33 | 31 | 37 | I/O | P0.6 — Port 0 bit 6. |
| | | | | I/O | AD6 — Address/data bit 6. |
| P0.7/AD7 | 32 | 30 | 36 | I/O | P0.7 — Port 0 bit 7. |
| | | | | I/O | AD7 — Address/data bit 7. |
| P1.0 to P1.7 | | | | I/O with internal pull-up | Port 1: Port 1 is an 8-bit bidirectional I/O port with internal pull-ups. The Port 1 pins are pulled high by the internal pull-ups when '1's are written to them and can be used as inputs in this state. As inputs, Port 1 pins that are externally pulled LOW will source current (I_{IL}) because of the internal pull-ups. P1.5, P1.6, P1.7 have high current drive of 16 mA. |
| P1.0/T2 | 1 | 40 | 2 | I/O | P1.0 — Port 1 bit 0. |
| | | | | I | T2 — External count input to Timer/Counter 2 or Clock-out from Timer/Counter 2 |
| P1.1/T2EX | 2 | 41 | 3 | I/O | P1.1 — Port 1 bit 1. |
| | | | | I | T2EX: Timer/Counter 2 capture/reload trigger and direction control |
| P1.2 | 3 | 42 | 4 | I/O | P1.2 — Port 1 bit 2. |
| P1.3 | 4 | 43 | 5 | I/O | P1.3 — Port 1 bit 3. |
| P1.4 | 5 | 44 | 6 | I/O | P1.4 — Port 1 bit 4. |
| P1.5 | 6 | 1 | 7 | I/O | P1.5 — Port 1 bit 5. |
| P1.6 | 7 | 2 | 8 | I/O | P1.6 — Port 1 bit 6. |

Table 2. Pin description ...continued

| Symbol | Pin | | | Type | Description |
|--------------------------------|-------|--------|--------|---------------------------|---|
| | DIP40 | LQFP44 | PLCC44 | | |
| P1.7 | 8 | 3 | 9 | I/O | P1.7 — Port 1 bit 7. |
| P2.0 to P2.7 | | | | I/O with internal pull-up | Port 2: Port 2 is an 8-bit bidirectional I/O port with internal pull-ups. Port 2 pins are pulled HIGH by the internal pull-ups when '1's are written to them and can be used as inputs in this state. As inputs, Port 2 pins that are externally pulled LOW will source current (I_{IL}) because of the internal pull-ups. Port 2 sends the high-order address byte during fetches from external program memory and during accesses to external Data Memory that use 16-bit address (MOVX@DPTR). In this application, it uses strong internal pull-ups when transitioning to '1's. |
| P2.0/A8 | 21 | 18 | 24 | I/O | P2.0 — Port 2 bit 0. |
| | | | | O | A8 — Address bit 8. |
| P2.1/A9 | 22 | 19 | 25 | I/O | P2.1 — Port 2 bit 1. |
| | | | | O | A9 — Address bit 9. |
| P2.2/A10 | 23 | 20 | 26 | I/O | P2.2 — Port 2 bit 2. |
| | | | | O | A10 — Address bit 10. |
| P2.3/A11 | 24 | 21 | 27 | I/O | P2.3 — Port 2 bit 3. |
| | | | | O | A11 — Address bit 11. |
| P2.4/A12 | 25 | 22 | 28 | I/O | P2.4 — Port 2 bit 4. |
| | | | | O | A12 — Address bit 12. |
| P2.5/A13 | 26 | 23 | 29 | I/O | P2.5 — Port 2 bit 5. |
| | | | | O | A13 — Address bit 13. |
| P2.6/A14 | 27 | 24 | 30 | I/O | P2.6 — Port 2 bit 6. |
| | | | | O | A14 — Address bit 14. |
| P2.7/A15 | 28 | 25 | 31 | I/O | P2.7 — Port 2 bit 7. |
| | | | | O | A15 — Address bit 15. |
| P3.0 to P3.7 | | | | I/O with internal pull-up | Port 3: Port 3 is an 8-bit bidirectional I/O port with internal pull-ups. Port 3 pins are pulled HIGH by the internal pull-ups when '1's are written to them and can be used as inputs in this state. As inputs, Port 3 pins that are externally pulled LOW will source current (I_{IL}) because of the internal pull-ups. |
| P3.0/RXD | 10 | 5 | 11 | I | P3.0 — Port 3 bit 0. |
| | | | | I | RXD — Serial input port. |
| P3.1/TXD | 11 | 7 | 13 | O | P3.1 — Port 3 bit 1. |
| | | | | O | TXD — Serial output port. |
| P3.2/ $\overline{\text{INT0}}$ | 12 | 8 | 14 | I | P3.2 — Port 3 bit 2. |
| | | | | I | $\overline{\text{INT0}}$ — External interrupt 0 input. |
| P3.3/ $\overline{\text{INT1}}$ | 13 | 9 | 15 | I | P3.3 — Port 3 bit 3. |
| | | | | I | $\overline{\text{INT1}}$ — External interrupt 1 input |
| P3.4/T0 | 14 | 10 | 16 | I/O | P3.4 — Port 3 bit 4. |
| | | | | I | T0 — External count input to Timer/Counter 0. |

Table 2. Pin description ...continued

| Symbol | Pin | | | Type | Description |
|------------------------------|-------|--------|--------|------|--|
| | DIP40 | LQFP44 | PLCC44 | | |
| P3.5/T1/CEX4 | 15 | 11 | 17 | I/O | P3.5 — Port 3 bit 5. |
| | | | | I | T1 — External count input to Timer/Counter 1 |
| P3.6/ $\overline{\text{WR}}$ | 16 | 12 | 18 | O | P3.6 — Port 3 bit 6. |
| | | | | O | $\overline{\text{WR}}$ — External data memory write strobe |
| P3.7/ $\overline{\text{RD}}$ | 17 | 13 | 19 | O | P3.7 — Port 3 bit 7. |
| | | | | O | $\overline{\text{RD}}$ — External data memory read strobe. |
| $\overline{\text{PSEN}}$ | 29 | 26 | 32 | I/O | Program Store Enable: $\overline{\text{PSEN}}$ is the read strobe for external program memory. When the device is executing from internal program memory, $\overline{\text{PSEN}}$ is inactive (HIGH). When the device is executing code from external program memory, $\overline{\text{PSEN}}$ is activated twice each machine cycle, except that two $\overline{\text{PSEN}}$ activations are skipped during each access to external data memory. |
| RST | 9 | 4 | 10 | I | Reset: While the oscillator is running, a HIGH logic state on this pin for two machine cycles will reset the device. |
| $\overline{\text{EA}}$ | 31 | 29 | 35 | I | External Access Enable: $\overline{\text{EA}}$ must be connected to V_{SS} in order to enable the device to fetch code from the external program memory. $\overline{\text{EA}}$ must be strapped to V_{DD} for internal program execution. |
| ALE | 30 | 27 | 33 | I/O | Address Latch Enable: ALE is the output signal for latching the low byte of the address during an access to external memory. Normally the ALE ^[1] is emitted at a constant rate of $\frac{1}{6}$ the crystal frequency ^[2] and can be used for external timing and clocking. One ALE pulse is skipped during each access to external data memory. However, if AO is set to '1', ALE is disabled. |
| XTAL1 | 19 | 15 | 21 | I | Crystal 1: Input to the inverting oscillator amplifier and input to the internal clock generator circuits. |
| XTAL2 | 18 | 14 | 20 | O | Crystal 2: Output from the inverting oscillator amplifier. |
| V_{DD} | 40 | 38 | 44 | I | Power supply |
| V_{SS} | 20 | 16 | 22 | I | Ground |

[1] ALE loading issue: When ALE pin experiences higher loading (>30 pF) during the reset, the microcontroller may accidentally enter into modes other than normal working mode. The solution is to add a pull-up resistor of 3 kΩ to 50 kΩ to V_{DD} , e.g., for ALE pin.

[2] For 6-clock mode, ALE is emitted at $\frac{1}{3}$ of crystal frequency.

6. Functional description

6.1 Special function registers

Remark: SFR accesses are restricted in the following ways:

- User must **not** attempt to access any SFR locations not defined.
- Accesses to any defined SFR locations must be strictly for the functions for the SFRs.
- SFR bits labeled '-', '0' or '1' can **only** be written and read as follows:
 - '-' Unless otherwise specified, **must** be written with '0', but can return any value when read (even if it was written with '0'). It is a reserved bit and may be used in future derivatives.
 - '0' **must** be written with '0', and will return a '0' when read.
 - '1' **must** be written with '1', and will return a '1' when read.

Table 3. Special function registers

- [1] Unimplemented bits in SFRs (labeled '-') are 'X's (unknown) at all times. Unless otherwise specified, '1's should not be written to these bits since they may be used for other purposes in future derivatives. The reset values shown for these bits are '0's although they are unknown when read.

6.2 Memory organization

The various P89V52X2 memory spaces are as follows:

- DATA
128 B of internal data memory space (00H:7FH) accessed via direct or indirect addressing, using instructions other than MOVX and MOVC. All or part of the Stack may be in this area.
- IDATA
Indirect Data. 256 B of internal data memory space (00H:FFH) accessed via indirect addressing using instructions other than MOVX and MOVC. All or part of the Stack may be in this area. This area includes the DATA area and the 128 B immediately above it.
- SFR
Special Function Registers. Selected CPU registers and peripheral control and status registers, accessible only via direct addressing.
- CODE
64 kB of Code memory space, accessed as part of program execution and via the MOVC instruction. The P89V52X2 has 8 kB of on-chip Code memory.

6.3 System clock and clock options

6.3.1 Clock input options and recommended capacitor values for the oscillator

Shown in [Figure 5](#) and [Figure 6](#) are the input and output of an internal inverting amplifier (XTAL1, XTAL2), which can be configured for use as an on-chip oscillator.

When driving the device from an external clock source, XTAL2 should be left disconnected and XTAL1 should be driven. Power consumption can be further reduced by programming the EXTCLK bit (UCFG.0).

At start-up, the external oscillator may encounter a higher capacitive load at XTAL1 due to interaction between the amplifier and its feedback capacitance. However, the capacitance will not exceed 15 pF once the external signal meets the V_{IL} and V_{IH} specifications.

Resonator manufacturer, supply voltage, and other factors may cause circuit performance to differ from one application to another. C_1 and C_2 should be adjusted appropriately for each design. [Table 4](#) shows the typical values for C_1 and C_2 vs. resonator type for various frequencies

Table 4. Recommended values for C_1 and C_2 by crystal type

| Resonator | $C_1 = C_2$ |
|-----------|----------------|
| Quartz | 20 pF to 30 pF |
| Ceramic | 40 pF to 50 pF |

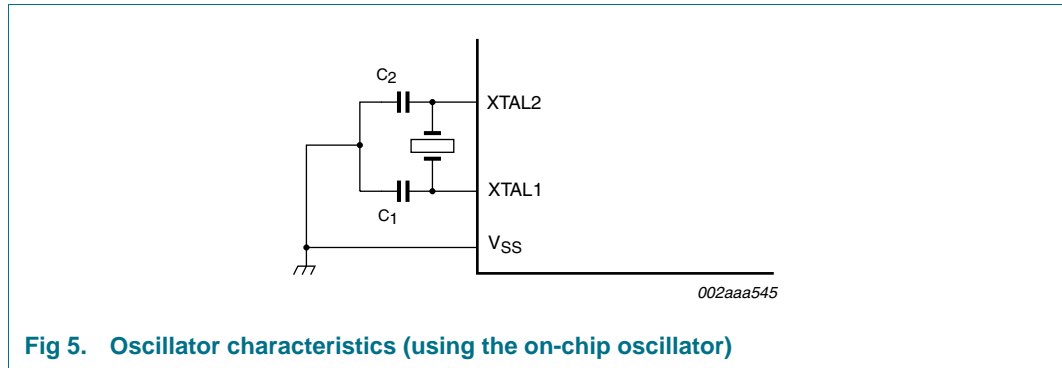

Fig 5. Oscillator characteristics (using the on-chip oscillator)

Fig 6. Oscillator characteristics (external clock drive)

6.3.2 Clock control register (CKCON)

By default, the device runs at twelve clocks per machine cycle. The device may be run in 6 clock per machine cycle mode by programming of either a non-volatile bit (FX2) or an SFR bit (Table 5 “Clock modes”). If the FX2 non-volatile bit is programmed the device will run in 6-clock mode and the X2 SFR bit has no effect. If the FX2 bit is erased, then the clock mode is controlled by the X2 SFR bit.

Table 5. Clock modes

| FX2 clock mode bit (UCFG.1) | X2 bit (CLKCON.0) | CPU clock mode |
|-----------------------------|-------------------|-------------------------|
| erased | 0 | 12-clock mode (default) |
| erased | 1 | 6-clock mode |
| programmed | x | 6-clock mode |

6.4 ALE control

Table 6. AUXR - Auxiliary register (address 8EH) bit allocation

Not bit addressable; Reset value 00H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|---|---|----|
| Symbol | - | - | - | - | - | - | - | AO |

Table 7. AUXR - Auxiliary register (address 8EH) bit description

| Bit | Symbol | Description |
|--------|--------|---|
| 7 to 1 | - | Reserved for future use. Should be set to '0' by user programs. |
| 0 | AO | ALE off: disables/enables ALE. AO = 0 results in ALE emitted at a constant rate of 1/2 the oscillator frequency. In case of AO = 1, ALE is active only during a MOVX or MOVC. |

Fig 7. Internal and external data memory structure

6.5 Dual data pointers

The device has two 16-bit data pointers. The DPTR Select (DPS) bit in AUXR1 determines which of the two data pointers is accessed. When DPS = 0, DPTR0 is selected; when DPS = 1, DPTR1 is selected. Quickly switching between the two data pointers can be accomplished by a single INC instruction on AUXR1 (see [Figure 8](#)).

Fig 8. Dual data pointer organization

| Symbol | - | - | - | - | GF2 | 0 | - | DPS |

Table 9. AUXR1 - Auxiliary register 1 (address A2H) bit description

| Bit | Symbol | Description |
|--------|--------|--|
| 7 to 4 | - | Reserved for future use. Should be set to '0' by user programs. |
| 3 | GF2 | General purpose user-defined flag. |
| 2 | 0 | This bit contains a hard-wired '0'. Allows toggling of the DPS bit by incrementing AUXR1, without interfering with other bits in the register. |
| 1 | - | Reserved for future use. Should be set to '0' by user programs. |
| 0 | DPS | Data pointer select. Chooses one of two Data Pointers for use by the program. See text for details. |

6.6 Reset

At initial power-up, the port pins will be in a random state until the oscillator has started and the internal reset algorithm has weakly pulled all pins high. Powering up the device without a valid reset could cause the device to start executing instructions from an indeterminate location. Such undefined states may inadvertently corrupt the code in the flash. A system reset will not affect the on-chip RAM while the device is running, however, the contents of the on-chip RAM during power-up are indeterminate.

When power is applied to the device, the RST pin must be held high long enough for the oscillator to start-up (usually several milliseconds for a low frequency crystal), in addition to two machine cycles for a valid power-on reset. An example of a method to extend the RST signal is to implement a RC circuit by connecting the RST pin to V_{DD} through a 10 μF capacitor and to V_{SS} through an 8.2 kΩ resistor as shown in [Figure 9](#).

During initial power the POF flag in the PCON register is set to indicate an initial power-up condition. The POF flag will remain active until cleared by software.

Following a reset condition, under normal conditions, the device will start executing code from address 0000H in the user's code memory. However if the requirements are met for ICP entry, the device will enter ICP mode.

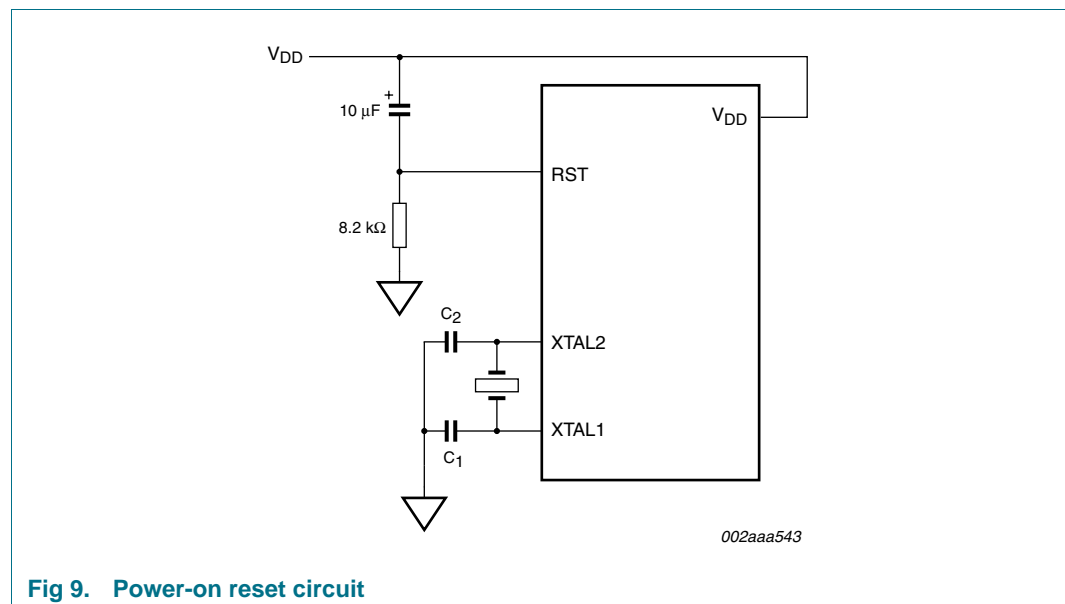

Fig 9. Power-on reset circuit

6.7 Flash memory

6.7.1 Flash organization

The P89V52X2 program memory consists of an 8 kB block of user code. The flash can be read or written in bytes but may only be erased as an entire block. A chip erase function will erase the entire user code memory and its associated security bits. This flash memory can be erased or programmed using a programmer tool that supports ICP.

6.7.2 Features

- Flash internal program memory
- Programming and erase over the full operating voltage range.
- Programming with industry-standard commercial programmers.
- 10 000 typical erase/program cycles for each byte.
- 100 year minimum data retention.

6.8 Timers/counters 0 and 1

The two 16-bit Timer/Counter registers: Timer 0 and Timer 1 can be configured to operate either as timers or event counters (see [Table 10](#) and [Table 11](#)).

In the 'Timer' function, the register is incremented every machine cycle. Thus, one can think of it as counting machine cycles. Since a machine cycle consists of six oscillator periods, the count rate is $\frac{1}{6}$ of the oscillator frequency.

In the 'Counter' function, the register is incremented in response to a 1-to-0 transition at its corresponding external input pin, T0 or T1. In this function, the external input is sampled once every machine cycle.

When the samples show a high in one cycle and a low in the next cycle, the count is incremented. The new count value appears in the register in the machine cycle following the one in which the transition was detected. Since it takes two machine cycles (12 oscillator periods) for 1-to-0 transition to be recognized, the maximum count rate is $\frac{1}{12}$ of the oscillator frequency. There are no restrictions on the duty cycle of the external input signal, but to ensure that a given level is sampled at least once before it changes, it should be held for at least one full machine cycle. In addition to the 'Timer' or 'Counter' selection, Timer 0 and Timer 1 have four operating modes from which to select.

The 'Timer' or 'Counter' function is selected by control bits C/T in the Special Function Register TMOD. These two Timer/Counters have four operating modes, which are selected by bit-pairs (M1, M0) in TMOD. Modes 0, 1, and 2 are the same for both Timers/Counters. Mode 3 is different. The four operating modes are described in the following text.

Table 10. TMOD - Timer/Counter mode control register (address 89H) bit allocation

Not bit addressable; Reset value: 0000 0000B; Reset source(s): any source

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

6.8.1 Mode 0

Putting either Timer into Mode 0 makes it look like an 8048 Timer, which is an 8-bit Counter with a fixed divide-by-32 prescaler. [Figure 10](#) shows Mode 0 operation.

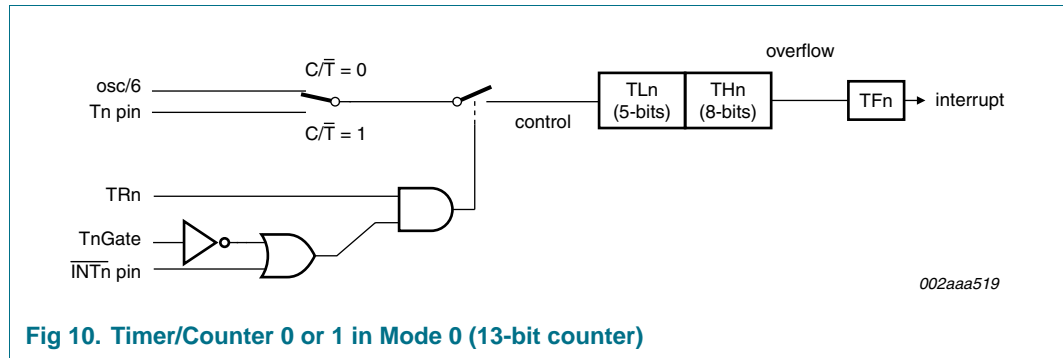

Fig 10. Timer/Counter 0 or 1 in Mode 0 (13-bit counter)

In this mode, the Timer register is configured as a 13-bit register. As the count rolls over from all 1s to all 0s, it sets the Timer interrupt flag TF_n . The count input is enabled to the Timer when $TR_n = 1$ and either $\overline{GATE} = 0$ or $\overline{INT_n} = 1$. (Setting $GATE = 1$ allows the Timer to be controlled by external input $\overline{INT_n}$, to facilitate pulse width measurements). TR_n is a control bit in the Special Function Register TCON ([Figure 8](#)). The GATE bit is in the TMOD register.

The 13-bit register consists of all 8 bits of TH_n and the lower 5 bits of TL_n . The upper 3 bits of TL_n are indeterminate and should be ignored. Setting the run flag (TR_n) does not clear the registers.

Mode 0 operation is the same for Timer 0 and Timer 1 (see [Figure 10](#)). There are two different GATE bits, one for Timer 1 (TMOD.7) and one for Timer 0 (TMOD.3).

6.8.2 Mode 1

Mode 1 is the same as Mode 0, except that all 16 bits of the timer register (TH_n and TL_n) are used. See [Figure 11](#).

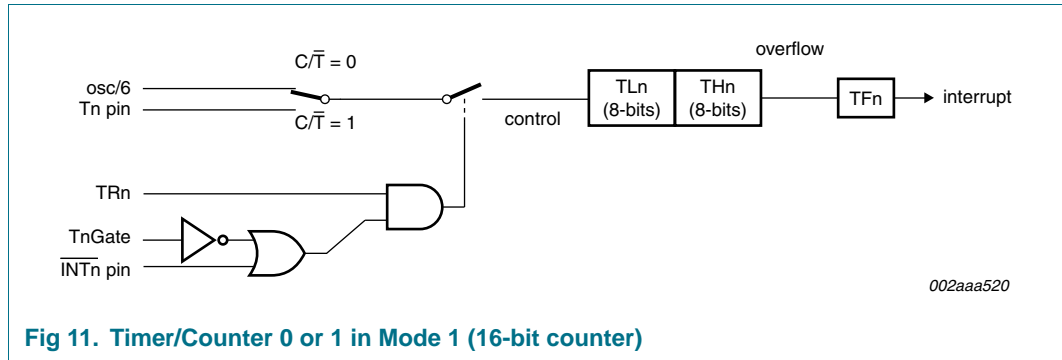

Fig 11. Timer/Counter 0 or 1 in Mode 1 (16-bit counter)

6.8.3 Mode 2

Mode 2 configures the Timer register as an 8-bit Counter (TLn) with automatic reload, as shown in Figure 12. Overflow from TLn not only sets TFn, but also reloads TLn with the contents of THn, which must be preset by software. The reload leaves THn unchanged. Mode 2 operation is the same for Timer 0 and Timer 1.

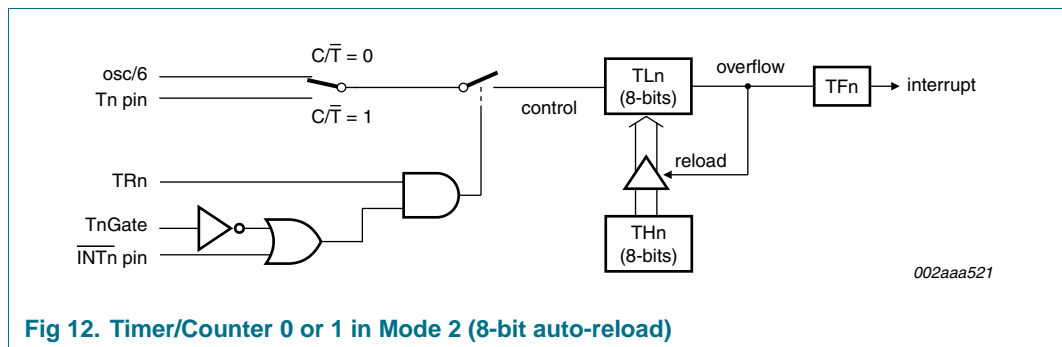

Fig 12. Timer/Counter 0 or 1 in Mode 2 (8-bit auto-reload)

6.8.4 Mode 3

When timer 1 is in Mode 3 it is stopped (holds its count). The effect is the same as setting $TR1 = 0$.

Timer 0 in Mode 3 establishes TL0 and TH0 as two separate 8-bit counters. The logic for Mode 3 and Timer 0 is shown in Figure 13. TL0 uses the Timer 0 control bits: $T0C/\bar{T}$, $T0GATE$, $TR0$, $INT0$, and $TF0$. TH0 is locked into a timer function (counting machine cycles) and takes over the use of $TR1$ and $TF1$ from Timer 1. Thus, TH0 now controls the 'Timer 1' interrupt.

Mode 3 is provided for applications that require an extra 8-bit timer. With Timer 0 in Mode 3, the P89V52X2 can look like it has an additional Timer.

Note: When Timer 0 is in Mode 3, Timer 1 can be turned on and off by switching it into and out of its own Mode 3. It can still be used by the serial port as a baud rate generator, or in any application not requiring an interrupt.

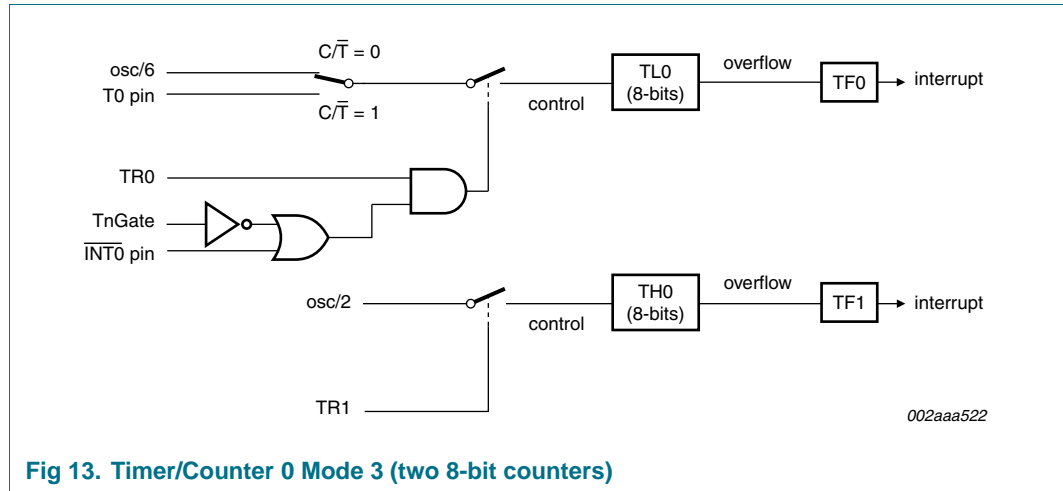

Fig 13. Timer/Counter 0 Mode 3 (two 8-bit counters)

6.9 Timer 2

Timer 2 is a 16-bit Timer/Counter which can operate as either an event timer or an event counter, as selected by C/T2 in the special function register T2CON. Timer 2 has four operating modes: Capture, Auto-reload (up or down counting), Clock-out, and Baud Rate Generator which are selected according to [Table 15](#) using T2CON ([Table 16](#) and [Table 17](#)) and T2MOD ([Table 18](#) and [Table 19](#)).

Table 15. Timer 2 operating mode

| RCLK+TCLK | CP/RL2 | TR2 | T2OE | Mode |
|-----------|--------|-----|------|------------------------|
| 0 | 0 | 1 | 0 | 16-bit auto reload |
| 0 | 1 | 1 | 0 | 16-bit capture |
| 0 | 0 | 1 | 1 | Programmable Clock-Out |
| 1 | X | 1 | 0 | Baud rate generator |

Table 17. T2CON - Timer/Counter 2 control register (address C8H) bit description

| Bit | Symbol | Description |
|-----|--------|--|
| 7 | TF2 | Timer 2 overflow flag set by a Timer 2 overflow and must be cleared by software. TF2 will not be set when either RCLK or TCLK = 1 or when Timer 2 is in Clock-out mode. |
| 6 | EXF2 | Timer 2 external flag is set when Timer 2 is in capture, reload or baud rate mode, EXEN2 = 1 and a negative transition on T2EX occurs. If Timer 2 interrupt is enabled EXF2 = 1 causes the CPU to vector to the Timer 2 interrupt routine. EXF2 must be cleared by software. |
| 5 | RCLK | Receive clock flag. When set, causes the UART to use Timer 2 overflow pulses for its receive clock in modes 1 and 3. RCLK = 0 causes Timer 1 overflow to be used for the receive clock. |

Table 17. T2CON - Timer/Counter 2 control register (address C8H) bit description ...continued

| Bit | Symbol | Description |
|-----|--------|--|
| 4 | TCLK | Transmit clock flag. When set, causes the UART to use Timer 2 overflow pulses for its transmit clock in modes 1 and 3. TCLK = 0 causes Timer 1 overflows to be used for the transmit clock. |
| 3 | EXEN2 | Timer 2 external enable flag. When set, allows a capture or reload to occur as a result of a negative transition on T2EX if Timer 2 is not being used to clock the serial port. EXEN2 = 0 causes Timer 2 to ignore events at T2EX. |
| 2 | TR2 | Start/stop control for Timer 2. A logic '1' enables the timer to run. |
| 1 | C/T2 | Timer or counter select. (Timer 2) 0 = internal timer ($f_{osc}/6$) 1 = External event counter (falling edge triggered; external clock's maximum rate = $f_{osc}/12$) |
| 0 | CP/RL2 | Capture/Reload flag. When set, captures will occur on negative transitions at T2EX if EXEN2 = 1. When cleared, auto-reloads will occur either with Timer 2 overflows or negative transitions at T2EX when EXEN2 = 1. When either RCLK = 1 or TCLK = 1, this bit is ignored and the timer is forced to auto-reload on Timer 2 overflow. |

| 1 | T2OE | Timer 2 Output Enable bit. Used in programmable clock-out mode only. |
| 0 | DCEN | Down Count Enable bit. When set, this allows Timer 2 to be configured as an up/down-counter. |

6.9.1 Capture mode

In the Capture mode there are two options which are selected by bit EXEN2 in T2CON. If EXEN2 = 0 Timer 2 is a 16-bit timer or counter (as selected by C/T2 in T2CON) which upon overflowing sets bit TF2, the Timer 2 overflow bit.

The capture mode is illustrated in [Figure 14](#).

Fig 14. Timer 2 in Capture mode

This bit can be used to generate an interrupt (by enabling the Timer 2 interrupt bit in the IEN0 register). If EXEN2 = 1, Timer 2 operates as described above, but with the added feature that a 1- to -0 transition at external input T2EX causes the current value in the Timer 2 registers, TL2 and TH2, to be captured into registers RCAP2L and RCAP2H, respectively.

In addition, the transition at T2EX causes bit EXF2 in T2CON to be set, and EXF2 like TF2 can generate an interrupt (which vectors to the same location as Timer 2 overflow interrupt). The Timer 2 interrupt service routine can interrogate TF2 and EXF2 to determine which event caused the interrupt.

There is no reload value for TL2 and TH2 in this mode. Even when a capture event occurs from T2EX, the counter keeps on counting T2 pin transitions or $f_{osc}/6$ pulses. Since once loaded contents of RCAP2L and RCAP2H registers are not protected, once Timer2 interrupt is signalled it has to be serviced before new capture event on T2EX pin occurs. Otherwise, the next falling edge on T2EX pin will initiate reload of the current value from TL2 and TH2 to RCAP2L and RCAP2H and consequently corrupt their content related to previously reported interrupt.

6.9.2 Auto-reload mode (up or down-counter)

In the 16-bit auto-reload mode, Timer 2 can be configured as either a timer or counter (via $C/\bar{T}2$ in T2CON), then programmed to count up or down. The counting direction is determined by bit DCEN (Down-counter Enable) which is located in the T2MOD register (see [Table 18](#) and [Table 19](#)). When reset is applied, DCEN = 0 and Timer 2 will default to counting up. If the DCEN bit is set, Timer 2 can count up or down depending on the value of the T2EX pin.

[Figure 15](#) shows Timer 2 counting up automatically (DCEN = 0).

Fig 15. Timer 2 in auto-reload mode (DCEN = 0)

In this mode, there are two options selected by bit EXEN2 in T2CON register. If EXEN2 = 0, then Timer 2 counts up to 0FFFFH and sets the TF2 (Overflow Flag) bit upon overflow. This causes the Timer 2 registers to be reloaded with the 16-bit value in RCAP2L and RCAP2H. The values in RCAP2L and RCAP2H are preset by software means.

Auto reload frequency when Timer 2 is counting up can be determined from this formula:

$$\frac{\text{SupplyFrequency}}{(65536 \angle (RCAP2H, RCAP2L))} \tag{1}$$

Where SupplyFrequency is either f_{osc} ($C/\overline{T2} = 0$) or frequency of signal on T2 pin ($C/\overline{T2} = 1$).

If EXEN2 = 1, a 16-bit reload can be triggered either by an overflow or by a 1-to-0 transition at input T2EX. This transition also sets the EXF2 bit. The Timer 2 interrupt, if enabled, can be generated when either TF2 or EXF2 is '1'.

Microcontroller's hardware will need three consecutive machine cycles in order to recognize falling edge on T2EX and set EXF2 = 1: in the first machine cycle pin T2EX has to be sampled as '1'; in the second machine cycle it has to be sampled as '0', and in the third machine cycle EXF2 will be set to '1'.

In [Figure 16](#), DCEN = 1 and Timer 2 is enabled to count up or down. This mode allows pin T2EX to control the direction of count. When a logic '1' is applied at pin T2EX Timer 2 will count up. Timer 2 will overflow at 0FFFFH and set the TF2 flag, which can then generate an interrupt, if the interrupt is enabled. This timer overflow also causes the 16-bit value in RCAP2L and RCAP2H to be reloaded into the timer registers TL2 and TH2.

Fig 16. Timer 2 in Auto Reload mode (DCEN = 1)

When a logic 0 is applied at pin T2EX this causes Timer 2 to count down. The timer will underflow when TL2 and TH2 become equal to the value stored in RCAP2L and RCAP2H. Timer 2 underflow sets the TF2 flag and causes 0FFFFH to be reloaded into the timer registers TL2 and TH2. The external flag EXF2 toggles when Timer 2 underflows or overflows. This EXF2 bit can be used as a 17th bit of resolution if needed.

6.9.3 Programmable clock-out

A 50 % duty cycle clock can be programmed to come out on pin T2 (P1.0). This pin, besides being a regular I/O pin, has two additional functions. It can be programmed:

1. To input the external clock for Timer/Counter 2, or
2. To output a 50 % duty cycle clock ranging from 122 Hz to 8 MHz at a 16 MHz operating frequency.

To configure the Timer/Counter 2 as a clock generator, bit $C/\bar{T}2$ (in T2CON) must be cleared and bit T2OE in T2MOD must be set. Bit TR2 (T2CON.2) also must be set to start the timer.

The Clock-Out frequency depends on the oscillator frequency and the reload value of Timer 2 capture registers (RCAP2H, RCAP2L) as shown in [Equation 2](#):

$$\frac{OscillatorFrequency}{2 \times (65536 \angle (RCAP2H, RCAP2L))} \tag{2}$$

Where (RCAP2H, RCAP2L) = the content of RCAP2H and RCAP2L taken as a 16-bit unsigned integer.

In the Clock-Out mode Timer 2 rollovers will not generate an interrupt. This is similar to when it is used as a baud rate generator.

6.9.4 Baud rate generator mode

Bits TCLK and/or RCLK in T2CON allow the UART transmit and receive baud rates to be derived from either Timer 1 or Timer 2 (See [Section 6.10](#) for details). When TCLK = 0, Timer 1 is used as the UART transmit baud rate generator. When TCLK = 1, Timer 2 is

used as the UART transmit baud rate generator. RCLK has the same effect for the UART receive baud rate. With these two bits, the serial port can have different receive and transmit baud rates – Timer 1 or Timer 2.

Figure 17 shows Timer 2 in baud rate generator mode:

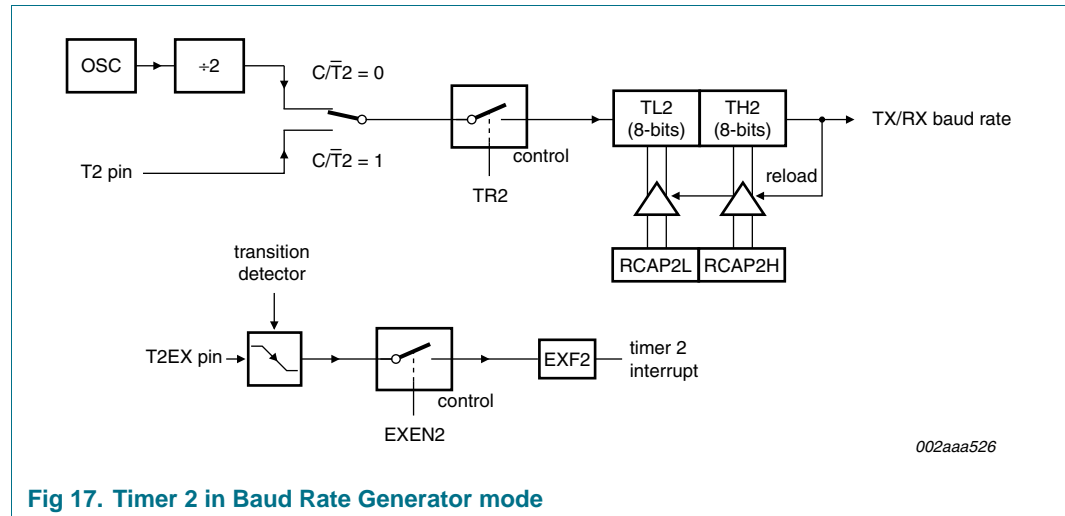

Fig 17. Timer 2 in Baud Rate Generator mode

The baud rate generation mode is like the auto-reload mode, when a rollover in TH2 causes the Timer 2 registers to be reloaded with the 16-bit value in registers RCAP2H and RCAP2L, which are preset by software.

The baud rates in modes 1 and 3 are determined by Timer 2's overflow rate given below:

$$\text{Modes 1 and 3 Baud Rates} = \text{Timer 2 Overflow Rate}/16$$

The timer can be configured for either 'timer' or 'counter' operation. In many applications, it is configured for 'timer' operation ($C/\bar{T}2 = 0$). Timer operation is different for Timer 2 when it is being used as a baud rate generator.

Usually, as a timer it would increment every machine cycle (i.e., $1/6$ the oscillator frequency). As a baud rate generator, it increments at the oscillator frequency. Thus the baud rate formula is as follows:

$$\text{Modes 1 and 3 Baud Rates} = \frac{\text{OscillatorFrequency}}{(16 \times (65536 - (RCAP2H, RCAP2L)))} \tag{3}$$

Where: (RCAP2H, RCAP2L) = The content of RCAP2H and RCAP2L taken as a 16-bit unsigned integer.

The Timer 2 as a baud rate generator mode is valid only if RCLK and/or TCLK = 1 in T2CON register. Note that a rollover in TH2 does not set TF2, and will not generate an interrupt. Thus, the Timer 2 interrupt does not have to be disabled when Timer 2 is in the baud rate generator mode. Also if the EXEN2 (T2 external enable flag) is set, a 1-to-0 transition in T2EX (Timer/counter 2 trigger input) will set EXF2 (T2 external flag) but will not cause a reload from (RCAP2H, RCAP2L) to (TH2, TL2). Therefore when Timer 2 is in use as a baud rate generator, T2EX can be used as an additional external interrupt, if needed.

When Timer 2 is in the baud rate generator mode, one should not try to read or write TH2 and TL2. Under these conditions, a read or write of TH2 or TL2 may not be accurate. The RCAP2 registers may be read, but should not be written to, because a write might overlap a reload and cause write and/or reload errors. The timer should be turned off (clear TR2) before accessing the Timer 2 or RCAP2 registers. [Table 20](#) shows commonly used baud rates and how they can be obtained from Timer 2.

6.9.5 Summary of baud rate equations

Timer 2 is in baud rate generating mode. If Timer 2 is being clocked through pin T2 (P1.0) the baud rate is:

$$\text{Baud rate} = \text{Timer 2 overflow rate} / 16$$

If Timer 2 is being clocked internally, the baud rate is:

$$\text{Baud rate} = f_{\text{osc}} / (16 \times (65536 - (\text{RCAP2H}, \text{RCAP2L})))$$

Where f_{osc} = oscillator frequency

To obtain the reload value for RCAP2H and RCAP2L, the above equation can be rewritten as:

$$\text{RCAP2H}, \text{RCAP2L} = 65536 - f_{\text{osc}} / (16 \times \text{baud rate})$$

Table 20. Timer 2 generated commonly used baud rates

| Rate | Oscillator frequency | Timer 2 | |
|----------|----------------------|---------|--------|
| | | RCAP2H | RCAP2L |
| 750 kBd | 12 MHz | FF | FF |

| 600 Bd | 6 MHz | FD | 8F |
| 220 Bd | 6 MHz | F9 | 57 |

6.10 UART

The UART operates in all standard modes. Enhancements over the standard 80C51 UART include Framing Error detection, and automatic address recognition.

6.10.1 Mode 0

Serial data enters and exits through RXD and TXD outputs the shift clock. Only 8 bits are transmitted or received, LSB first. The baud rate is fixed at $\frac{1}{6}$ of the CPU clock frequency. UART configured to operate in this mode outputs serial clock on TXD line no matter whether it sends or receives data on RXD line.

6.10.2 Mode 1

10 bits are transmitted (through TXD) or received (through RXD): a start bit (logical 0), 8 data bits (LSB first), and a stop bit (logical 1). When data is received, the stop bit is stored in RB8 in Special Function Register SCON. The baud rate is variable and is determined by the Timer 1/2 overflow rate.

6.10.3 Mode 2

11 bits are transmitted (through TXD) or received (through RXD): start bit (logical 0), 8 data bits (LSB first), a programmable 9th data bit, and a stop bit (logical 1). When data is transmitted, the 9th data bit (TB8 in SCON) can be assigned the value of 0 or (e.g. the parity bit (P, in the PSW) could be moved into TB8). When data is received, the 9th data bit goes into RB8 in Special Function Register SCON, while the stop bit is ignored. The baud rate is programmable to either 1/16 or 1/32 of the CPU clock frequency, as determined by the SMOD1 bit in PCON.

6.10.4 Mode 3

11 bits are transmitted (through TXD) or received (through RXD): a start bit (logical 0), 8 data bits (LSB first), a programmable 9th data bit, and a stop bit (logical 1). In fact, Mode 3 is the same as Mode 2 in all respects except baud rate. The baud rate in Mode 3 is variable and is determined by the Timer 1/2 overflow rate.

Table 21. SCON - Serial port control register (address 98H) bit allocation

Bit addressable; Reset value: 00H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|--------|-----|-----|-----|-----|-----|----|----|
| Symbol | SM0/FE | SM1 | SM2 | REN | TB8 | RB8 | TI | RI |

Table 22. SCON - Serial port control register (address 98H) bit description

| Bit | Symbol | Description |
|-----|--------|---|
| 7 | SM0/FE | The usage of this bit is determined by SMOD0 in the PCON register. If SMOD0 = 0, this bit is SM0, which with SM1, defines the serial port mode. If SMOD0 = 1, this bit is FE (Framing Error). FE is set by the receiver when an invalid stop bit is detected. Once set, this bit cannot be cleared by valid frames but can only be cleared by software. (Note: It is recommended to set up UART mode bits SM0 and SM1 before setting SMOD0 to '1'.) |
| 6 | SM1 | With SM0, defines the serial port mode (see Table 23 below). |
| 5 | SM2 | Enables the multiprocessor communication feature in Modes 2 and 3. In Mode 2 or 3, if SM2 is set to '1', then RI will not be activated if the received 9th data bit (RB8) is '0'. In Mode 1, if SM2 = 1 then RI will not be activated if a valid stop bit was not received. In Mode 0, SM2 should be '0'. |
| 4 | REN | Enables serial reception. Set by software to enable reception. Clear by software to disable reception. |
| 3 | TB8 | The 9th data bit that will be transmitted in Modes 2 and 3. Set or clear by software as desired. |

Table 22. SCON - Serial port control register (address 98H) bit description ...continued

| Bit | Symbol | Description |
|-----|--------|---|
| 2 | RB8 | In Modes 2 and 3, is the 9th data bit that was received. In Mode 1, if SM2 = 0, RB8 is the stop bit that was received. In Mode 0, RB8 is undefined. |
| 1 | TI | Transmit interrupt flag. Set by hardware at the end of the 8th bit time in Mode 0, or at the stop bit in the other modes, in any serial transmission. Must be cleared by software. |
| 0 | RI | Receive interrupt flag. Set by hardware at the end of the 8th bit time in Mode 0, or approximately halfway through the stop bit time in all other modes. (See SM2 for exceptions). Must be cleared by software. |

Table 23. SCON - Serial port control register (address 98H) SM0/SM1 mode definition

| SM0, SM1 | UART mode | Baud rate |
|----------|-------------------|------------------------------|
| 0 0 | 0: shift register | CPU clock/6 |
| 0 1 | 1: 8-bit UART | variable |
| 1 0 | 2: 9-bit UART | CPU clock/32 or CPU clock/16 |
| 1 1 | 3: 9-bit UART | variable |

6.10.5 Framing error

Framing error (FE) is reported in the SCON.7 bit if SMOD0 (PCON.6) = 1. If SMOD0 = 0, SCON.7 is the SM0 bit for the UART, it is recommended that SM0 is set up before SMOD0 is set to '1'.

6.10.6 More about UART mode 1

Reception is initiated by a detected 1-to-0 transition at RXD. For this purpose RXD is sampled at a rate of 16 times whatever baud rate has been established. When a transition is detected, the divide-by-16 counter is immediately reset to align its rollovers with the boundaries of the incoming bit times.

The 16 states of the counter divide each bit time into 16ths. At the 7th, 8th, and 9th counter states of each bit time, the bit detector samples the value of RXD. The value accepted is the value that was seen in at least 2 of the 3 samples. This is done for noise rejection. If the value accepted during the first bit time is not 0, the receive circuits are reset and the unit goes back to looking for another 1-to-0 transition. This is to provide rejection of false start bits. If the start bit proves valid, it is shifted into the input shift register, and reception of the rest of the frame will proceed.

The signal to load SBUF and RB8, and to set RI, will be generated if, and only if, the following conditions are met at the time the final shift pulse is generated: (a) RI = 0, and (b) Either SM2 = 0, or the received stop bit = 1.

If either of these two conditions is not met, the received frame is irretrievably lost. If both conditions are met, the stop bit goes into RB8, the 8 data bits go into SBUF, and RI is activated.

6.10.7 More about UART modes 2 and 3

Reception is performed in the same manner as in mode 1.

The signal to load SBUF and RB8, and to set RI, will be generated if, and only if, the following conditions are met at the time the final shift pulse is generated: (a) RI = 0, and (b) Either SM2 = 0, or the received 9th data bit = 1.

If either of these conditions is not met, the received frame is irretrievably lost, and RI is not set. If both conditions are met, the received 9th data bit goes into RB8, and the first 8 data bits go into SBUF.

6.10.8 Multiprocessor communications

UART modes 2 and 3 have a special provision for multiprocessor communications. In these modes, 9 data bits are received or transmitted. When data is received, the 9th bit is stored in RB8. The UART can be programmed so that when the stop bit is received, the serial port interrupt will be activated only if RB8 = 1. This feature is enabled by setting bit SM2 in SCON. One way to use this feature in multiprocessor systems is as follows:

When the master processor wants to transmit a block of data to one of several slaves, it first sends out an address byte which identifies the target slave. An address byte differs from a data byte in a way that the 9th bit is '1' in an address byte and '0' in the data byte. With SM2 = 1, no slave will be interrupted by a data byte, i.e. the received 9th bit is '0'. However, an address byte having the 9th bit set to '1' will interrupt all slaves, so that each slave can examine the received byte and see if it is being addressed or not. The addressed slave will clear its SM2 bit and prepare to receive the data (still 9 bits long) that follow. The slaves that weren't being addressed leave their SM2 bits set and go on about their business, ignoring the subsequent data bytes.

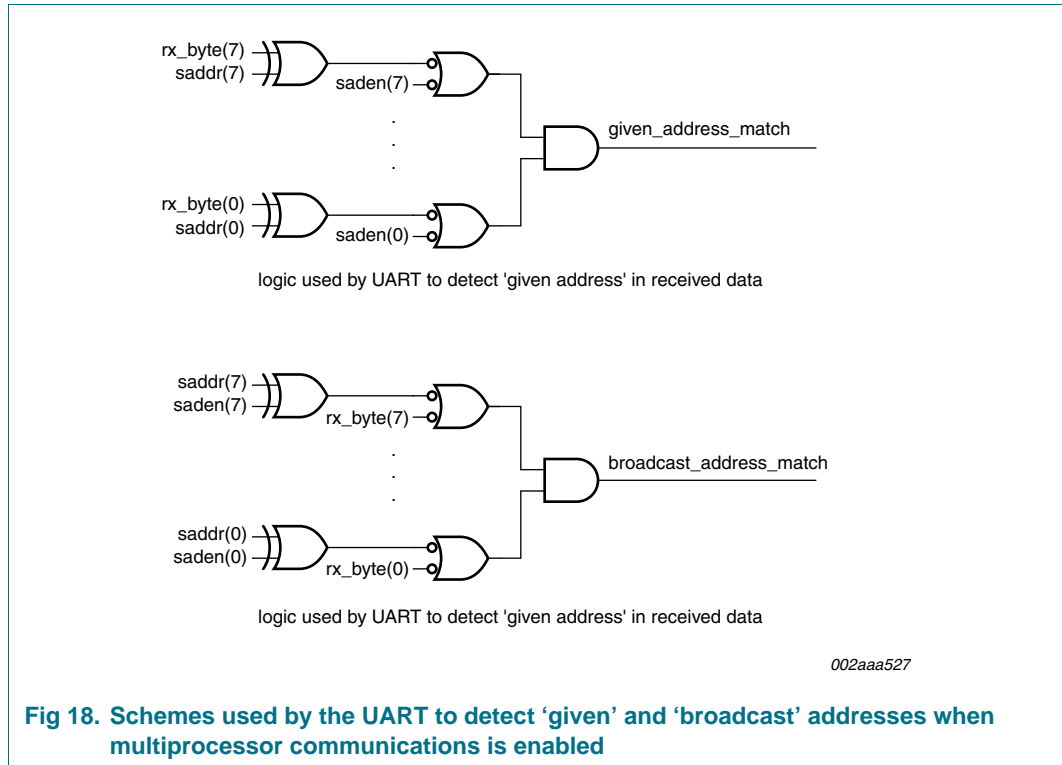

SM2 has no effect in Mode 0, and in Mode 1 can be used to check the validity of the stop bit, although this is better done with the Framing Error flag. When UART receives data in mode 1 and SM2 = 1, the receive interrupt will not be activated unless a valid stop bit is received.

6.10.9 Automatic address recognition

Automatic Address Recognition is a feature which allows the UART to recognize certain addresses in the serial bit stream by using hardware to make the comparisons. This feature saves a great deal of software overhead by eliminating the need for the software to examine every serial address which passes by the serial port. This feature is enabled for the UART by setting the SM2 bit in SCON. In the 9 bit UART modes, mode 2 and mode 3, the Receive Interrupt flag (RI) will be automatically set when the received byte contains either the 'Given' address or the 'Broadcast' address. The 9 bit mode requires that the 9th information bit is a '1' to indicate that the received information is an address and not data.

Using the Automatic Address Recognition feature allows a master to selectively communicate with one or more slaves by invoking the Given slave address or addresses. All of the slaves may be contacted by using the Broadcast address. Two Special Function Registers are used to define the slave's address, SADDR, and the address mask, SADEN. SADEN is used to define which bits in the SADDR are to be used and which bits are 'don't care'. The SADEN mask can be logically ANDed with the SADDR to create the 'Given' address which the master will use for addressing each of the slaves. Use of the Given address allows multiple slaves to be recognized while excluding others.

This device uses the methods presented in [Figure 18](#) to determine if a 'Given' or 'Broadcast' address has been received or not.

The following examples will help to show the versatility of this scheme.

Example 1, slave 0:

$$\begin{array}{r}
 \text{SADDR} = 1100\ 0000 \\
 \underline{\text{SADEN} = 1111\ 1101} \\
 \text{Given} = 1100\ 00X0
 \end{array} \tag{4}$$

Example 2, slave 1:

$$\begin{array}{r}
 \text{SADDR} = 1100\ 0000 \\
 \underline{\text{SADEN} = 1111\ 1110} \\
 \text{Given} = 1100\ 000X
 \end{array} \tag{5}$$

In the above example SADDR is the same and the SADEN data is used to differentiate between the two slaves. Slave 0 requires a '0' in bit 0 and it ignores bit 1. Slave 1 requires a '0' in bit 1 and bit 0 is ignored. A unique address for Slave 0 would be 1100 0010 since slave 1 requires a '0' in bit 1. A unique address for slave 1 would be 1100 0001 since a '1' in bit 0 will exclude slave 0. Both slaves can be selected at the same time by an address which has bit 0 = 0 (for slave 0) and bit 1 = 0 (for slave 1). Thus, both could be addressed with 1100 0000.

In a more complex system the following could be used to select slaves 1 and 2 while excluding slave 0:

Example 1, slave 0:

$$\begin{aligned} \text{SADDR} &= 1100\ 0000 \\ \underline{\text{SADEN} &= 1111\ 1001} \\ \text{Given} &= 1100\ 0XX0 \end{aligned} \tag{6}$$

Example 2, slave 1:

$$\begin{aligned} \text{SADDR} &= 1110\ 0000 \\ \underline{\text{SADEN} &= 1111\ 1010} \\ \text{Given} &= 1110\ 0X0X \end{aligned} \tag{7}$$

Example 2, slave 2:

$$\begin{aligned} \text{SADDR} &= 1100\ 0000 \\ \underline{\text{SADEN} &= 1111\ 1100} \\ \text{Given} &= 1100\ 00XX \end{aligned} \tag{8}$$

In the above example the differentiation among the 3 slaves is in the lower 3 address bits. Slave 0 requires that bit 0 = 0 and it can be uniquely addressed by 1110 0110. Slave 1 requires that bit 1 = 0 and it can be uniquely addressed by 1110 0101. Slave 2 requires that bit 2 = 0 and its unique address is 1110 0011. To select Slaves 0 and 1 and exclude Slave 2 use address 1110 0100, since it is necessary to make bit 2 = 1 to exclude slave 2. The Broadcast Address for each slave is created by taking the logical OR of SADDR and SADEN. Zeros in this result are treated as don't-cares. In most cases, interpreting the don't-cares as ones, the broadcast address will be FF hexadecimal. Upon reset SADDR and SADEN are loaded with 0s. This produces a given address of all 'don't cares' as well as a Broadcast address of all 'don't cares'. This effectively disables the Automatic Addressing mode and allows the microcontroller to use standard UART drivers which do not make use of this feature.

6.11 Interrupt priority and polling sequence

The device supports six interrupt sources under a four level priority scheme. [Table 24](#) summarizes the polling sequence of the supported interrupts. (See [Figure 19](#)).

Table 24. Interrupt polling sequence

| Description | Interrupt flag | Vector address | Interrupt enable | Interrupt priority | Service priority | Wake-up Power-down |
|----------------------|----------------|----------------|------------------|--------------------|------------------|--------------------|
| External Interrupt 0 | IE0 | 0003H | EX0 | PX0/H | 1 (highest) | yes |
| T0 | TF0 | 000BH | ET0 | PT0/H | 2 | no |
| External Interrupt 1 | IE1 | 0013H | EX1 | PX1/H | 3 | yes |
| T1 | TF1 | 001BH | ET1 | PT1/H | 4 | no |
| UART | TI/RI | 0023H | ES0 | PS0/H | 5 | no |
| T2 | TF2, EXF2 | 003BH | ET2 | PT2/H | 6 | no |

6.12 Power-saving modes

The device provides two power saving modes of operation for applications where power consumption is critical. The two modes are idle and Power-down, see [Table 31](#).

6.12.1 Idle mode

Idle mode is entered setting the IDL bit in the PCON register. In Idle mode, the program counter is stopped. The system clock continues to run and all interrupts and peripherals remain active. The on-chip RAM and the special function registers hold their data during this mode.

The device exits Idle mode through either a system interrupt or a hardware reset. Exiting Idle mode via system interrupt, the start of the interrupt clears the IDL bit and exits Idle mode. After exit the Interrupt Service Routine, the interrupted program resumes execution beginning at the instruction immediately following the instruction which invoked the Idle mode. A hardware reset starts the device similar to a power-on reset.

6.12.2 Power-down mode

The Power-down mode is entered by setting the PD bit in the PCON register. In the Power-down mode, the clock is stopped and external interrupts are active for level sensitive interrupts only. SRAM contents are retained during Power-down, the minimum V_{DD} level is 2.0 V.

The device exits Power-down mode through either an enabled external level sensitive interrupt or a hardware reset. The start of the interrupt clears the PD bit and exits Power-down. Holding the external interrupt pin low restarts the oscillator, the signal must hold low at least 1024 clock cycles before bringing back high to complete the exit. Upon interrupt signal restored to logic V_{IH} , the interrupt service routine program execution resumes beginning at the instruction immediately following the instruction which invoked Power-down mode. A hardware reset starts the device similar to power-on reset.

To exit properly out of Power-down, the reset or external interrupt should not be executed before the V_{DD} line is restored to its normal operating voltage. Be sure to hold V_{DD} voltage long enough at its normal operating level for the oscillator to restart and stabilize (normally less than 10 ms).

Table 31. Power-saving modes

| Mode | Initiated by | State of device | Exited by |
|-----------------|--|---|---|
| Idle mode | Software (Set IDL bit in PCON) MOV PCON, #01H; | CLK is running. Interrupts, serial port and timers/counters are active. Program Counter is stopped. ALE and PSEN signals at a HIGH-level during Idle. All registers remain unchanged. | Enabled interrupt or hardware reset. Start of interrupt clears IDL bit and exits Idle mode, after the ISR RETI instruction, program resumes execution beginning at the instruction following the one that invoked Idle mode. A hardware reset restarts the device similar to a power-on reset. |
| Power-down mode | Software (Set PD bit in PCON) MOV PCON, #02H; | CLK is stopped. On-chip SRAM and SFR data is maintained. ALE and PSEN signals at a LOW-level during power-down. External Interrupts are only active for level sensitive interrupts, if enabled. | Enabled external level sensitive interrupt or hardware reset. Start of interrupt clears PD bit and exits Power-down mode, after the ISR RETI instruction program resumes execution beginning at the instruction following the one that invoked Power-down mode. A hardware reset restarts the device similar to a power-on reset. |

6.13 Data EEPROM

The P89V52X2 contains 192 B of data EEPROM organized into three pages of 64 B each. This memory can be erased in 64 byte pages (using a Page Erase command) or erased and written as bytes. The P89V52X2 flash reliably stores memory contents even after 100000 erase and program cycles. The cell is designed to optimize the erase and programming mechanisms. P89V52X2 uses V_{DD} as the supply voltage to perform the Program/Erase algorithms.

The data EEPROM must be mapped into the code memory address space in order to read, erase, or program the data EEPROM. The memory is read using the MOVC instruction.

6.13.1 Features

- ICP with industry-standard commercial programmers
- IAP-Lite allows individual and multiple bytes of data EEPROM to be programmed under control of the end application.
- Programming and erase over the full operating voltage range
- Programming/Erase using ICP or IAP-Lite
- Program or erases requires 2 ms, 4 ms, or 6 ms, depending on the operation
- Programmable security for the data in each page
- > 100000 typical erase/program cycles for each byte
- Data EEPROM mapped into code space for quick MOVC reading

6.13.2 Register interface

Erasing, programming, and mapping operations are performed in the application under the control of the microcontroller's firmware using four SFRs and an internal 64-byte 'page register'. These SFRs are:

- FMCON (Flash Control Register). When read, this is the status register. When written, this is a command register. Note that the status bits are cleared to logic 0s when the command is written.
- FMADRL, FMADRH (Flash memory address low, Flash memory address high). Used to specify the byte address within the page register or specify the page within user code memory (for programming, erase, and reading the data EEPROM is mapped into the user address space (see [Table 32](#)).
- FMDATA (Flash Data Register). Accepts data to be loaded into the page register.

Data is read by mapping the data EEPROM into the code memory space and using the MOVC instruction.

6.13.3 Mapping the data EEPROM into code space

In order to read, erase, or program the data EEPROM must be mapped into the code memory address space. This is accomplished by writing the MAP command (09H) to FMCON. The data EEPROM may be unmapped by writing the UNMAP command (0AH) to FMCON. The mapping of the data EEPROM pages into code memory space is shown in [Table 32](#).

Table 32. Data EEPROM page addresses

| Data EEPROM page | Start address | End address |
|------------------|---------------|-------------|
| 0 | FF00H | FF3FH |
| 1 | FF40H | FF7FH |
| 2 | FF80H | FFBFH |

6.13.4 Reading the data EEPROM

Reading the data EEPROM can be achieved by performing the following sequence:

- Map the data EEPROM into code memory space if not already mapped.
- Write the data EEPROM byte address into the DPTR.
- Use the MOVC instruction to read the data EEPROM.

6.13.5 Erasing a complete page (64 B)

A complete page can be erased by performing the following sequence:

- Map the data EEPROM into code memory space if not already mapped.
- Write the lower 8-bits of the data EEPROM page's start address into FMADRL.
- Write the ERS_DP command (33H) to FMCON.

Once the ERS_DP command is written to FMCON, code execution will stall until the operation is completed, approximately 6 ms.

6.13.6 Data EEPROM programming and erasing using the page register

In addition to page erase, a 64 B page register is included which allows from 1 B to 64 B of a given page to be programmed or erase/programmed at the same time, substantially reducing overall programming time. Two programming operations are provided:

- Program only operation. This operation used the PROG (48H) command and programs the contents of the page register into the data EEPROM page. This operation requires that the bytes being programmed have been previously erased. This operation requires approximately 2 ms to complete.
- Erase and Program operation. This operation uses the EP (68H) command to both erase and program the bytes previously loaded into the page register. This command is often useful to erase and reprogram a single byte of data. This operation requires approximately 4 ms to complete.

The page register consists of 64 B and an update flag for each byte. When a LOAD command is issued to FMCON the page register contents and all of the update flags will be cleared. When FMDATA is written, the value written to FMDATA will be stored in the page register at the location specified by the lower 6 bits of FMADRL. In addition, the update flag for that location will be set. FMADRL will auto-increment to the next location. Auto-increment after writing to the last byte in the page register will 'wrap-around' to the first byte in the page register, but will not affect FMADRL[7:6]. Bytes loaded into the page register do not have to be continuous. Any byte location can be loaded into the page register by changing the contents of FMADRL prior to writing to FMDATA. However, each location in the page register can only be written once following each LOAD command. Attempts to write to a page register location more than once should be avoided.

FMADRH and FMADRL[7:6] are used to specify a page in the code memory space. When the PROG command is written to FMCON, the locations within the data EEPROM page that correspond to updated locations in the page register will have their contents programmed with the contents of their corresponding locations in the page register. Only the bytes that were loaded into the page register will be programmed in the data EEPROM array. Other bytes within the data EEPROM array will not be affected. The EP command works similarly except that If the EP command is written, the corresponding bytes in the data EEPROM will be erased prior to being programmed. This is often useful for erasing and programming a small number of bytes or even a single byte.

Writing either the PROG or EP command to FMCON will start the program or erase-program process and place the CPU in a program-idle state. The CPU will remain in this idle state until the program or erase-program cycle is completed. Interrupts will NOT be serviced until the cycle is completed.

Erase-program or programming of a single byte (or multiple bytes) in the data EEPROM array is accomplished using the following steps:

- Write the LOAD command (00H) to FMCON. The LOAD command will clear all locations in the page register and their corresponding update flags.
- Write the address within the page register to FMADRL. Since the loading the page register uses FMADRL[5:0], and since the erase-program or program command uses FMADRH and FMADRL[7:6], the user can write the byte location within the page register (FMADRL[5:0]) and the code memory page address (FMADRH and FMADRL[7:6]) at this time.
- Write the data to be programmed to FMDATA. This will increment FMADRL pointing to the next byte in the page register.
- Write the address of the next byte to be programmed to FMADRL, if desired. (This is not needed for contiguous bytes since FMADRL is auto-incremented). All bytes to be programmed must be within the same page.
- Write the data for the next byte to be programmed to FMDATA.
- Repeat writing of FMADRL and/or FMDATA until all desired bytes have been loaded into the page register.
- Write the page address mapped into user code memory to FMADRH and FMADRL[7:6], if not previously included when writing the page register address to FMADRL[5:0].
- Write the EP (68H) or PROG (48H) command to FMCON, starting the erase-program or program cycle.
- Read FMCON to check status. If aborted, repeat starting with the LOAD command.

Table 33. Flash Memory Control register (FMCON - address E4H) bit allocation

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|---------|---------|---------|---------|---------|---------|---------|---------|
| Symbol (R) | BUSY | WE | - | DAP | - | - | SV | ERR |
| Symbol (W) | FMCMD.7 | FMCMD.6 | FMCMD.5 | FMCMD.4 | FMCMD.3 | FMCMD.2 | FMCMD.1 | FMCMD.0 |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 34. Flash Memory Control register (FMCON - address E4H) bit description

| Bit | Symbol | Access | Description |
|-----|---------|--------|---|
| 0 | ERR | R | Set when either of the following conditions occur: <ul style="list-style-type: none"> • Device was reset before the operation was completed. • Attempt made to access data EEPROM while Data Access Protect (DAP) is set. • An error occurs in the device's internal high voltage circuits. |
| | FMCMD.0 | W | Command byte bit 0. |
| 1 | SV | R | Security violation. Set when an attempt is made to program, erase, or CRC a secured page. The specific cause of the security violation depends on the operation: <ul style="list-style-type: none"> • PROG or EP: CSEC.0 = 1 or DPxSEC.1 = 1 for the page addressed by FMADRH/L. • ERS_G: Any DPxSEC.0 = 1. • ERS_DP: DPxSEC.2 = 1 for addressed page while in execution mode. • CRC_DP: DPxCSEC.0 = 1 and DPxSEC.1 = 0 |
| | FMCMD.1 | W | Command byte bit 1 |
| 2 | - | R | Reserved |
| | FMCMD.2 | W | Command byte bit 2. |
| 3 | - | R | Reserved |
| | FMCMD.3 | W | Command byte bit 3. |
| 4 | DAP | R | Data Access Protect. When set, access to the data EEPROM is unmapped and thus prohibited. Set by the MAP command. Cleared by the UNMAP command. |
| | FMCMD.4 | W | Command byte bit 4. |
| 5 | - | R | Reserved |
| | FMCMD.5 | W | Command byte bit 5. |
| 6 | WE | R | When set, indicates that data EEPROM writes during program execution are enabled. |
| | FMCMD.6 | W | Command byte bit 6. |
| 7 | BUSY | R | Indicates that a program, erase, CRC calculation or similar operation is in progress. Note that this bit is usable only in ICP mode since the CPU is stalled whenever this bit is set in execution mode. |
| | FMCMD.7 | W | Command byte bit 7. |

An assembly language routine to load the page register and perform an erase/program operation is shown below. This code assumes the data EEPROM has been mapped into user code space.

if ((Fm_stat & 0x0F)!=0) prog_fail=1; else prog_fail=0;
return(prog_fail);
}
    
```

6.13.7 Data EEPROM write enable

The data EEPROM has a Write Enable mechanism to help prevent against inadvertent writes. If the WE bit (FMCON.6) is set writes to the data EEPROM are enabled. When cleared, writes are disabled. This bit only affects execution mode. The WE bit is set when:

- The disable write enable bit, DISWE (UCFG.2) = 1
- In ICP mode
- The SET_WE (08H) command is written to FMCON followed by the key value (96H) being written to FMDATA

The WE bit is cleared following any reset. The WE bit may also be cleared by writing the CLR_WE (0BH) command to FMCON.

6.13.8 Data EEPROM security bits

The data EEPROM security bits protects each data EEPROM page. The data EEPROM page security bits and their effects are shown in [Table 35](#).

Table 35. DPxSEC - Data page X security register bit allocation

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|-------|------|-------|
| Symbol | - | - | - | - | - | XERSx | PWRx | MOVCx |

Table 36. DPxSEC - Data page X security register bit description

| Bit | Symbol | Description |
|--------|--------|---|
| 7 to 3 | - | Reserved |
| 2 | XERSx | Execution Erase Protect x. When programmed = 1, cannot be erased with ERS_DP command in execution mode. ERS_DP can be used in ICP mode. |
| 1 | PWRx | Page Write Protect x. When programmed = 1, data EEPROM cannot be erased or programmed using PROG or EP commands. |
| 0 | MOVCx | When programmed = 1, prevents instructions fetched from off-chip from reading the contents of the data EEPROM and returns FFH. CRC_DP are disabled if the corresponding Page Write Protect is disabled. |

6.13.9 Summary of data EEPROM commands

is a summary of the FMCON commands related to the data EEPROM.

Table 37. Summary of data EEPROM commands

| Mnemonic | Value (hex) | Description |
|----------|-------------|---|
| CLR_WE | 0B | Clear the WE bit |
| CRC_DP | 1D | Calculate CRC on selected data EEPROM page |
| EP | 68 | Erase and Program data EEPROM page |
| ERS_DP | 33 | Erase data EEPROM page |
| LOAD | 00 | Reset and clear page register |
| MAP | 09 | Map data EEPROM into upper end of user code space |
| PROG | 48 | Program data EEPROM page |
| SET_WE | 08 | Set the WE bit if followed by writing key value to FMDATA |
| UNMAP | 0A | Unmap data EEPROM from user code space |

6.14 User configuration bytes

This device contains some non-volatile bytes which allow the user to configure the device. These bytes are programmed or read using the configuration read or write command (CONF) with a programmer that supports ICP. The user configuration bytes, their CONF address are shown in [Table 38](#).

Table 38. User configuration bytes

| Configuration byte | CONF address | Function |
|--------------------|--------------|--|
| UCFG | 00H | 6x/12x selection, ext clk select, disable WE |
| CSEC | 01H | Code security |
| DP0SEC | 02H | Data EEPROM, page 0, security |
| DP1SEC | 03H | Data EEPROM, page 1, security |
| DP2SEC | 04H | Data EEPROM, page 2, security |
| MFG_ID | 10H | Manufacturer signature byte |
| DEVIC_ID | 11H | Device id signature byte |
| DERIV_ID | 12H | Derivative id signature byte |

6.15 UCFG

The user configuration bits in the UCFG register allow the user to configure some of the operating characteristics of the device and are shown in [Table 39](#).

Table 39. UCFG - User configuration register bit allocation

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|-----|-----|--------|
| Symbol | - | - | - | - | - | ENW | FX2 | EXTCLK |

Table 40. UCFG - User configuration register bit description

| Bit | Symbol | Description |
|--------|--------|--|
| 7 to 3 | - | Reserved |
| 2 | ENW | Enable Write. When programmed = 1, forces the WE bit to be set. |
| 1 | FX2 | Force X2. When programmed = 1, the device is in 6-clock mode. When erased = 0, the mode depends on the state of the X2 bit in CKCON. |
| 0 | EXTCLK | External Clock. When programmed = 1, disables the XTAL block when using an external digital clock source. |

6.16 Code security (CSEC) bits

The code security bits protects against software piracy and prevents the contents of the flash from being read by unauthorized parties. The code security bits and their effects are shown in [Table 41](#).

Table 41. CSEC - Code security register bit allocation

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|---|---------|------|
| Symbol | - | - | - | - | - | - | INTEXEC | PROT |

Table 42. CSEC - Code security register bit description

| Bit | Symbol | Description |
|--------|---------|---|
| 7 to 2 | - | Reserved |
| 1 | INTEXEC | Internal execution only. When programmed, if the internal address space is exceeded, the address will rollover into internal space (upper address bits are ignored) for MOVC and instruction fetches. MOVC will access the data EEPROM when the address \geq FF00H. |
| 0 | PROT | Protect. When programmed, prohibits further erasing or programming of code memory. MOVC instructions executed from external code memory are disabled from fetching code bytes from internal code memory. |

7. Limiting values

Table 43. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V_{SS} unless otherwise noted.

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-----------------|---|--|------|----------------|------|
| $T_{amb(bias)}$ | bias ambient temperature | | -55 | +125 | °C |
| T_{stg} | storage temperature | | -65 | +150 | °C |
| V_n | voltage on any other pin | except V_{SS} , with respect to V_{DD} | -0.5 | $V_{DD} + 0.5$ | V |
| $I_{OL(I/O)}$ | LOW-level output current per input/output pin | | - | 15 | mA |
| $P_{tot(pack)}$ | total power dissipation (per package) | based on package heat transfer, not device power consumption | - | 1.5 | W |

8. Static characteristics

Table 44. Static characteristics

$T_a = -40\text{ °C to }+85\text{ °C}$; $V_{DD} = 2.7\text{ V to }5.5\text{ V}$; $V_{SS} = 0\text{ V}$

| Symbol | Parameter | Conditions | Min | Max | Unit |
|----------------|-----------------------------|---|--------------------|-------------------|---------------|
| $n_{endu(fl)}$ | endurance of flash memory | JEDEC Standard A117 | [1] 10000 | | cycles |
| $t_{ret(fl)}$ | flash memory retention time | JEDEC Standard A103 | [1] 100 | | years |
| I_{latch} | I/O latch-up current | JEDEC Standard 78 | [1] $100 + I_{DD}$ | | mA |
| $V_{th(HL)}$ | HIGH-LOW threshold voltage | | -0.5 | $0.2V_{DD} - 0.1$ | V |
| $V_{th(LH)}$ | LOW-HIGH threshold voltage | except XTAL1, RST | $0.2V_{DD} + 0.9$ | $V_{DD} + 0.5$ | V |
| V_{IH} | HIGH-level input voltage | XTAL1, RST | $0.7V_{DD}$ | 6.0 | V |
| V_{OL} | LOW-level output voltage | $V_{DD} = 4.5\text{ V}$ $I_{OL} = 3.2\text{ mA}$ | [2][3][4] - | 0.4 | V |
| V_{OH} | HIGH-level output voltage | $V_{DD} = 2.7\text{ V}$, ports 1, 2, 3 $I_{OH} = -20\text{ }\mu\text{A}$ | [5] $V_{DD} - 0.7$ | - | V |
| | | $V_{DD} = 4.5\text{ V}$, ports 1, 2, 3 $I_{OH} = -30\text{ }\mu\text{A}$ | [5] $V_{DD} - 0.7$ | - | V |
| | | $V_{DD} = 4.5\text{ V}$, Port 0 in External Bus mode, ALE, PSEN $I_{OH} = -3.2\text{ mA}$ | $V_{DD} - 0.7$ | - | V |
| I_{IL} | LOW-level input current | $V_I = 0.4\text{ V}$, ports 1, 2, 3 | -1 | -50 | μA |
| I_{THL} | HIGH-LOW transition current | $V_I = 2\text{ V}$, ports 1, 2, 3 | [6] - | -650 | μA |
| I_{LI} | input leakage current | $0.45\text{ V} < V_I < V_{DD} - 0.3\text{ V}$, port 0 | - | ± 10 | μA |
| R_{pd} | pull-down resistance | on pin RST | 40 | 225 | k Ω |
| C_{iss} | input capacitance | @ 1 MHz, $T_a = 25\text{ °C}$, $V_I = 0\text{ V}$ | [7] - | 15 | pF |
| $I_{DD(oper)}$ | operating supply current | $f_{osc} = 12\text{ MHz}$ | - | 3 | mA |
| | | $f_{osc} = 33\text{ MHz}$ | - | 7 | mA |

Table 44. Static characteristics ...continued

$T_a = -40\text{ }^{\circ}\text{C to }+85\text{ }^{\circ}\text{C}; V_{DD} = 2.7\text{ V to }5.5\text{ V}; V_{SS} = 0\text{ V}$

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-----------------------|--------------------------------|----------------------------------|-----|-----|---------------|
| $I_{DD(\text{idle})}$ | Idle mode supply current | $f_{\text{osc}} = 12\text{ MHz}$ | - | 1.7 | mA |
| | | $f_{\text{osc}} = 33\text{ MHz}$ | - | 3 | mA |
| $I_{DD(\text{pd})}$ | Power-down mode supply current | minimum $V_{DD} = 2\text{ V}$ | - | 15 | μA |

- [1] This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.
- [2] Under steady state (non-transient) conditions, I_{OL} must be externally limited as follows:
 - a) Maximum I_{OL} per 8-bit port: 26 mA
 - b) Maximum I_{OL} total for all outputs: 71 mA
 - c) If I_{OL} exceeds the test condition, V_{OH} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.
- [3] Capacitive loading on Ports 0 and 2 may cause spurious noise to be superimposed on the V_{OL} of ALE and Ports 1 and 3. The noise due to external bus capacitance discharging into the Port 0 and 2 pins when the pins make 1-to-0 transitions during bus operations. In the worst cases (capacitive loading > 100 pF), the noise pulse on the ALE pin may exceed 0.8 V. In such cases, it may be desirable to qualify ALE with a Schmitt trigger, or use an address latch with a Schmitt trigger STROBE input.
- [4] Load capacitance for Port 0, ALE and $\overline{\text{PSEN}} = 100\text{ pF}$, load capacitance for all other outputs = 80 pF.
- [5] Capacitive loading on Ports 0 and 2 may cause the V_{OH} on ALE and $\overline{\text{PSEN}}$ to momentarily fall below the $V_{DD} - 0.7$ specification when the address bits are stabilizing.
- [6] Pins of Ports 1, 2 and 3 source a transition current when they are being externally driven from 1 to 0. The transition current reaches its maximum value when V_I is approximately 2 V.
- [7] Pin capacitance is characterized but not tested. $\overline{\text{EA}} = 25\text{ pF}$ (max).

- (1) Maximum active I_{DD}
- (2) Maximum idle I_{DD}
- (3) Typical active I_{DD}
- (4) Typical idle I_{DD}

Fig 20. I_{DD} vs. frequency

9. Dynamic characteristics

Table 45. Dynamic characteristics

Over operating conditions: load capacitance for Port 0, ALE, and $\overline{\text{PSEN}}$ = 100 pF; load capacitance for all other outputs = 80 pF

$T_a = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$; $V_{DD} = 2.7\text{ V}$ to 5.5 V ; $V_{SS} = 0\text{ V}$ ^[1]

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------------|--|---------------|----------------------------|----------------------------|------|
| f _{osc} | oscillator frequency | 12-clock mode | 0 | 40 | MHz |
| | | 6-clock mode | 0 | 20 | MHz |
| | | ICP | 0.25 | 40 | MHz |
| t _{LHLL} | ALE pulse width | | 2T _{cy(clk)} – 15 | - | ns |
| t _{AVLL} | address valid to ALE LOW time | | T _{cy(clk)} – 15 | - | ns |
| t _{LLAX} | address hold after ALE LOW time | | T _{cy(clk)} – 15 | - | ns |
| t _{LLIV} | ALE LOW to valid instruction in time | | - | 4T _{cy(clk)} – 45 | ns |
| t _{LLPL} | ALE LOW to $\overline{\text{PSEN}}$ LOW time | | T _{cy(clk)} – 15 | - | ns |
| t _{PLPH} | $\overline{\text{PSEN}}$ pulse width | | 3T _{cy(clk)} – 15 | - | ns |
| t _{PLIV} | $\overline{\text{PSEN}}$ LOW to valid instruction in time | | - | 3T _{cy(clk)} – 50 | ns |
| t _{PXIX} | input instruction hold after $\overline{\text{PSEN}}$ time | | 0 | - | ns |
| t _{PXIZ} | input instruction float after $\overline{\text{PSEN}}$ time | | - | T _{cy(clk)} – 15 | ns |
| t _{PXAV} | $\overline{\text{PSEN}}$ to address valid time | | T _{cy(clk)} – 8 | - | ns |
| t _{AVIV} | address to valid instruction in time | | - | 5T _{cy(clk)} – 60 | ns |
| t _{PLAZ} | $\overline{\text{PSEN}}$ LOW to address float time | | - | 10 | ns |
| t _{RLRH} | $\overline{\text{RD}}$ LOW pulse width | | 6T _{cy(clk)} – 30 | - | ns |
| t _{WLWH} | $\overline{\text{WR}}$ LOW pulse width | | 6T _{cy(clk)} – 30 | - | ns |
| t _{RLDV} | $\overline{\text{RD}}$ LOW to valid data in time | | - | 5T _{cy(clk)} – 50 | ns |
| t _{RHDX} | data hold after $\overline{\text{RD}}$ time | | 0 | - | ns |
| t _{RHDZ} | data float after $\overline{\text{RD}}$ time | | - | 2T _{cy(clk)} – 12 | ns |
| t _{LLDV} | ALE LOW to valid data in time | | - | 8T _{cy(clk)} – 50 | ns |
| t _{AVDV} | address to valid data in time | | - | 9T _{cy(clk)} – 75 | ns |
| t _{LLWL} | ALE LOW to $\overline{\text{RD}}$ or $\overline{\text{WR}}$ LOW time | | 3T _{cy(clk)} – 15 | 3T _{cy(clk)} + 15 | ns |
| t _{AVWL} | address to $\overline{\text{RD}}$ or $\overline{\text{WR}}$ LOW time | | 4T _{cy(clk)} – 30 | - | ns |
| t _{WHQX} | data hold after $\overline{\text{WR}}$ time | | T _{cy(clk)} – 20 | - | ns |
| t _{QVWH} | data output valid to $\overline{\text{WR}}$ HIGH time | | 7T _{cy(clk)} – 50 | - | ns |
| t _{RLAZ} | $\overline{\text{RD}}$ LOW to address float time | | - | 0 | ns |
| t _{WHLH} | $\overline{\text{RD}}$ or $\overline{\text{WR}}$ HIGH to ALE HIGH time | | T _{cy(clk)} – 15 | T _{cy(clk)} + 15 | ns |

[1] T_{cy(clk)} = 1/f_{osc}.

[2] Calculated values are for 6-clock mode only.

9.1 Explanation of symbols

Each timing symbol has 5 characters. The first character is always a 't' (stands for time). The other characters, depending on their positions, stand for the name of a signal or the logical status of that signal. The following is a list of all the characters and what they stand for.

- A — Address
- C — Clock
- D — Input data
- H — Logic level HIGH
- I — Instruction (program memory contents)
- L — Logic level LOW or ALE
- P — $\overline{\text{PSEN}}$
- Q — Output data
- R — $\overline{\text{RD}}$ signal
- T — Time
- V — Valid
- W — $\overline{\text{WR}}$ signal
- X — No longer a valid logic level
- Z — High impedance (Float)

Example:

t_{AVLL} = Address valid to ALE LOW time

t_{LLPL} = ALE LOW to $\overline{\text{PSEN}}$ LOW time

13. Legal information

13.1 Data sheet status

| Document status ^{[1][2]} | Product status ^[3] | Definition |
|-----------------------------------|-------------------------------|---|
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

13.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

13.3 Disclaimers

General — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or

malfunction of a NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
